

THE STANDARD FAT LOSS SYSTEM

Training · Cardio · Nutrition · Check-Ins

"We're not meant to have the same body forever."

FEMININE STRENGTH CO.

Christin Fisher, CPT

How This Works

This isn't a 30-day shred. It's the system I run with every fat loss client — the same structure across the board, scaled to where you are right now. The structure never changes. Your numbers do.

What I've noticed coaching women in the thick of it: fat loss doesn't stall because you're not trying hard enough. It stalls because the plan asks for perfection instead of consistency. This plan asks for consistency.

The order of operations: lift to keep your muscle, walk to drive the deficit, eat enough protein to make both count. Cardio is the last lever we pull — not the first.

The Weekly Shape

Day	Focus	Time
Day 1	Strength — Lower (squat focus)	45–55 min
Day 2	Strength — Upper (push focus)	45–55 min
Day 3	Strength — Full Body (hinge focus)	45–55 min
Day 4	LISS cardio — zone 2	35–45 min
Day 5	Intervals	20 min
Daily	Steps: 8–10k (start at your average +2k)	—

Strength days can run Mon/Wed/Fri or whatever fits your actual life. The non-negotiable is that they happen — not when.

The Training Program

Every exercise has three tiers. Everyone runs the same program — a first-timer and a four-year client are just on different tiers. When you own the top of the rep range on every set, move up a tier or add 5–10% load. Rep ranges hold for 4 weeks, then week 5 is a deload (same movements, roughly 60% effort).

Day 1 — Lower (Squat Focus)

Exercise	Sets x Reps	Tier 1 (start here)	Tier 3 (progress to)
Squat	4 x 8	Box squat to bench	Barbell back squat
Romanian Deadlift	3 x 10	DB RDL, light	Barbell RDL
Walking Lunge	3 x 10/leg	Reverse lunge, bodyweight	DB walking lunge
Leg Curl / Glute Bridge	3 x 12	Floor glute bridge	Weighted hip thrust
Finisher: 8 min AMRAP	15 + 10	Squat to chair + step-outs	KB swings + jump squats

Day 2 — Upper (Push Focus)

Exercise	Sets x Reps	Tier 1 (start here)	Tier 3 (progress to)
Press	4 x 8	Incline push-up	DB bench press
Seated Row	3 x 10	Band row	Cable row, heavy
Overhead Press	3 x 10	Seated DB press, light	Standing barbell press
Lat Pulldown	3 x 12	Band pulldown	Weighted pulldown
Finisher: 8 min	20s on / 40s off	Fast march or bike sprint	Battle ropes / rower

Day 3 — Full Body (Hinge Focus)

Exercise	Sets x Reps	Tier 1 (start here)	Tier 3 (progress to)
Deadlift	4 x 6	KB deadlift from block	Trap bar deadlift
Incline Press	3 x 10	Incline push-up	Incline DB press
Split Squat	3 x 8/leg	Assisted split squat	Rear-foot elevated
Face Pull	3 x 15	Band pull-apart	Cable face pull
Farmer Carry	3 x 40 yds	Single DB suitcase carry	Heavy double KB carry

Progression rule: hit the top of every rep range with two reps left in the tank? Add 5–10% next week. That's it. No guessing, no maxing out, no heroics.

Cardio Protocol

Cardio doesn't earn food and it isn't punishment. It's a tool with two jobs: daily movement that quietly drives the deficit, and two structured sessions that keep your engine strong.

The Real Driver: Steps

Daily steps move the needle more than any single workout. Find your current 7-day average, add 2,000, and live there for two weeks before going up again. Target range: 8–10k daily.

Structured Session 1 — LISS

35–45 minutes at a pace where you can hold a conversation (zone 2). Incline walk, bike, rower — whichever one you'll actually do. This is recovery-friendly and doesn't spike hunger the way hard cardio does.

Structured Session 2 — Intervals

20 minutes total: 30 seconds hard, 90 seconds easy, repeated 8–10 times. “Hard” means you couldn't keep it up for 2 minutes — not all-out collapse.

The cardio rule: we never add cardio before adjusting food first. More cardio on top of too little food is how women end up exhausted, hungry, and stuck. Cardio is the LAST lever.

Nutrition Framework

Same system for everyone, different numbers for each body. No banned foods, no cleanses, no eating like you're apologizing for something.

Your Numbers

What	Formula	Example (170 lb, goal 150)
Calories (starting point)	Bodyweight (lbs) x 12	170 x 12 = ~2,040/day
Protein (the one we police)	0.8–1g per lb of goal weight	120–150g/day
Adjustments	±100–150 cal every 2 weeks	Based on trend, not one weigh-in

The Plate Method (what you actually follow)

Food	Per Meal	Your Hand Is the Measure
Protein	Every meal	1 palm (2 at dinner)
Vegetables	At least 2 meals	1 fist minimum
Carbs	Scaled to training days	1 cupped hand (add 1 on lifting days)
Fats	Every meal	1 thumb

Structure: 3 meals + 1–2 snacks, protein anchored at every one. The 80/20 rule applies — if 80% of your food does its job, the other 20% is yours. You've already done the restriction diets. We both know how those ended.

Sleep & Stress (yes, this is a nutrition section)

Poor sleep alone will stall fat loss with perfect adherence. It's not you — it's your body talking.

Minimums: a consistent wake time, 7+ hours in bed, and the phone out of arm's reach. If sleep is a 4/10, we fix that before we cut a single calorie.

Check-Ins & Adjustments

Progress is measured weekly, judged monthly. One bad weigh-in is water, sleep, stress, or your cycle — not failure.

Weekly Metrics

Metric	How Often	What We're Looking For
Scale weight	3x/week, averaged	Trend of 0.5–1% bodyweight/week down
Waist measurement	1x/week, same conditions	Slow downward trend
Photos	Every 2 weeks	Front / side / back, same lighting
Energy & sleep rating	Weekly, 1–10	Holding steady or improving

Losing faster than 1% per week? We add food back. Fast loss is muscle loss, and muscle is the whole point.

When Fat Loss Stalls — The Adjustment Ladder

Stalled means 3+ weeks with no trend change and honest adherence. Then we pull ONE lever at a time, in this order:

Step	Lever	The Move
1	Steps	Add 1–2k to the daily target
2	Calories	Drop 100–150/day
3	Cardio	Add ONE session — only after 1 and 2

Never all three at once. Slashing food and doubling cardio in the same week is a panic move, and panic moves are why the last plan didn't stick.

Questions between check-ins? Message me in Trainerize. That's what I'm here for.
